Smaller chemical analysis

By George S. Newth

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 46 pages. Dimensions: 9.7in. x 7.4in. x 0.1in. This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1906 edition. Excerpt: . . . CHAPTER VI REACTIONS OF THE METALS OF GROUP Mb Manganese, Mn Dry Reactions. --Manganese compounds, when heated in a borax bead in the oxidising flame, impart to the bead a violet or lilac colour. When heated in the reducing flame, the bead again becomes colourless. A more characteristic reaction is to fuse the manganese compound with KHO , or with NaO_3 and a little KN_3 or KC_2O_3 upon a piece of platinum foil; the manganese undergoes oxidation, and a deep green-coloured mass is obtained, consisting of manganates of the alkali metals-- $\text{MnO}_2\text{Na}_2\text{CO}_3$ (from KC_2O_3 or KN_3) $\text{Na}_2\text{MnO}_4\text{CO}_2$ Wet Reactions. --Of the common manganous salts, the chloride, $\text{MnCl}_2 \cdot 4\text{H}_2\text{O}$, and the sulphate, $\text{MnSO}_4 \cdot 5\text{H}_2\text{O}$, are soluble in water. In the crystallised state they have all a pink colour. Manganous salts which are soluble in water do not undergo atmospheric oxidation. NH_4HO , KHO , and NaHO produce a white precipitate...
